Projection maths

world coordinates => image coordinates

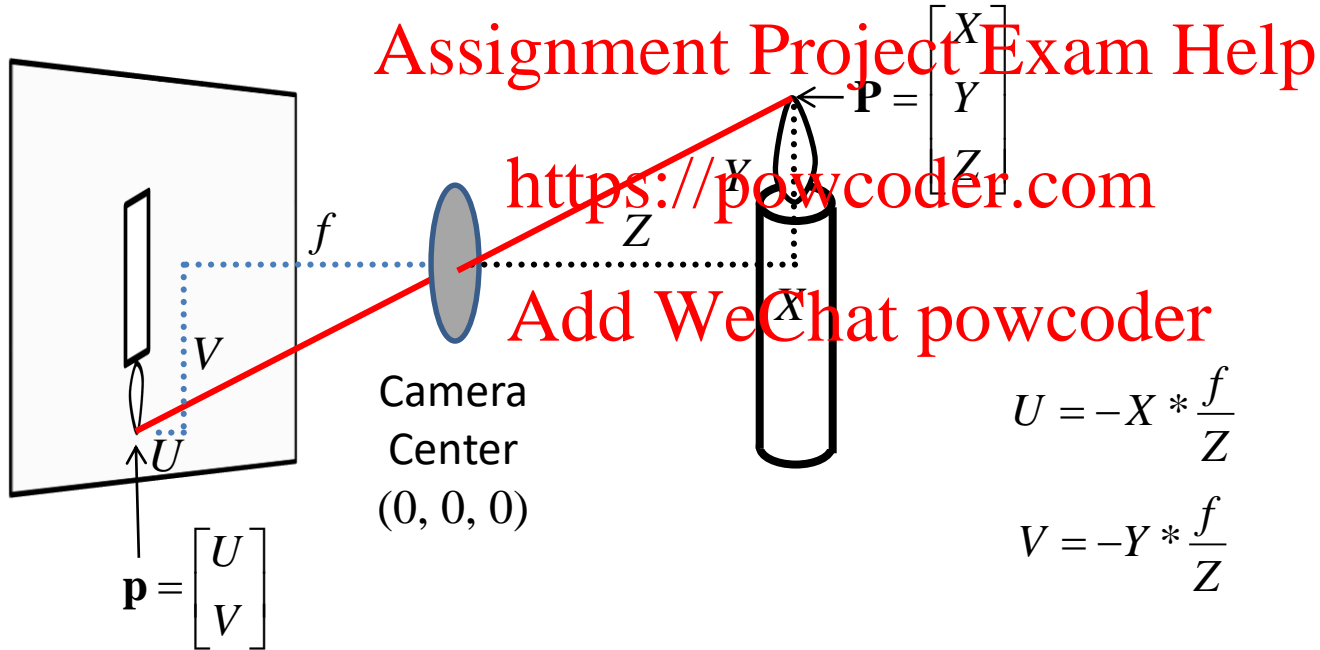

Projection maths

world coordinates \Rightarrow image coordinates

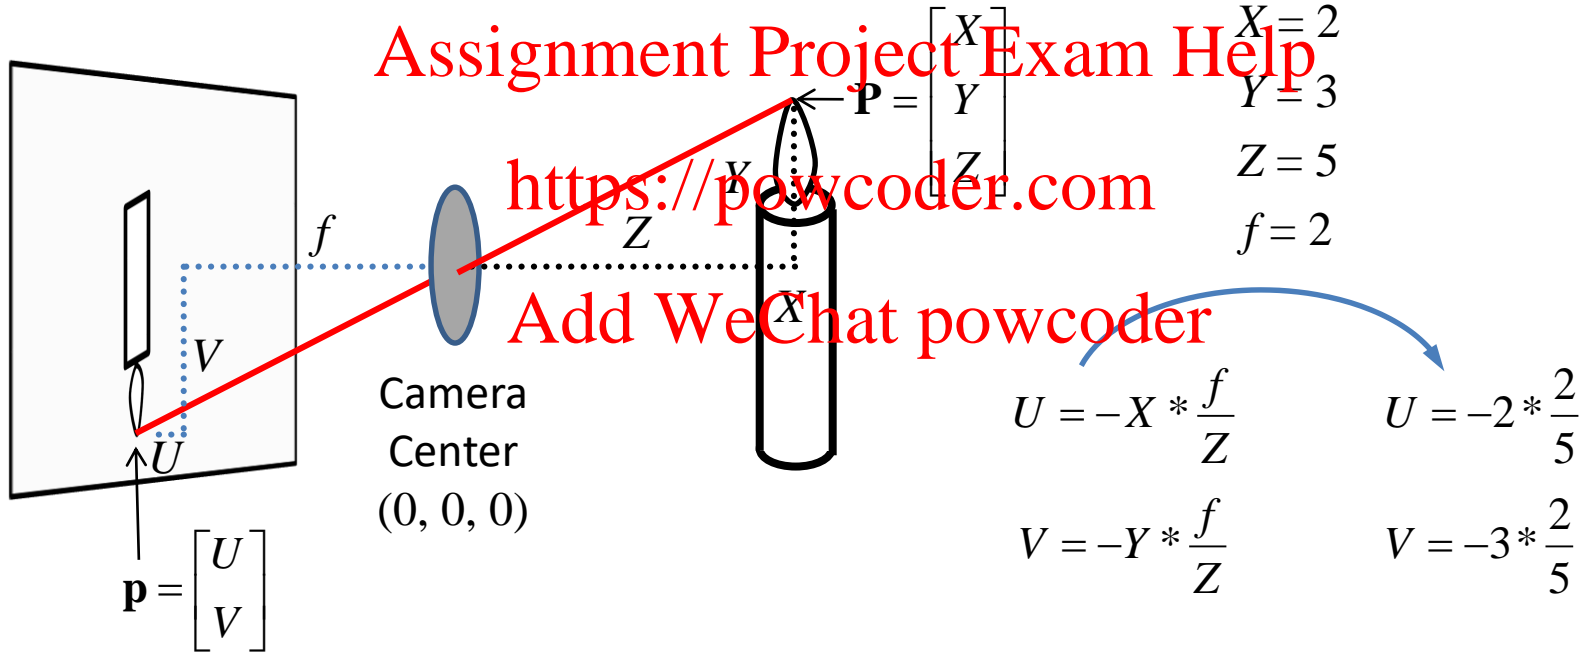

Projection maths

world coordinates => image coordinates

Projection maths

world coordinates > image coordinates

Perspective projection

- Apparent size of object depends on its distance:
far objects appear smaller
- By similar triangles

$$(x', y', z') = \left(f \frac{x}{z}, f \frac{y}{z}, -f\right)$$

- Ignore the third coordinate

$$(x', y') = \left(f \frac{x}{z}, f \frac{y}{z}\right)$$

Affine projection

- Suitable when scene depth is small relative to the average distance from the camera
- Let magnification $m = -f' / z_0$ be a positive constant, treat all points in the scene as at constant distance z_0 from camera
- Leads to weak perspective projection

$$(x', y') = (-mx, -my)$$

Affine projection

- Camera always remains at roughly constant distance from the scene

Assignment Project Exam Help

- Orthographic projection when m is normalised to -1

<https://powcoder.com>

$$(x', y') = (x, y)$$

Corrected barrel distortion

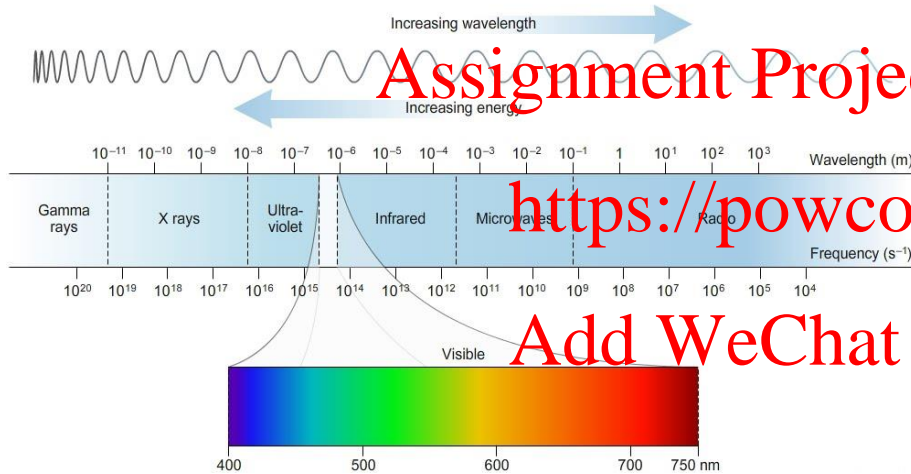

Comparing with human vision

- Cameras imitate the frequency response of the human eye, so it is good to know something about it
- Computer vision probably would not get as much attention if biological vision (especially human vision) had not proven that it is possible to make important judgements from 2D images

Digitisation by spatial sampling

- **Digitisation** converts an analog image to a digital image by sampling the image space
- Sampling digitises the coordinates x and y :
 - Spatial discretisation of a picture function $F(x, y)$
 - Uses a (typically rectangular) grid of sampling points:
$$x = j\Delta x, y = k\Delta y \quad | \quad j = 1 \dots M, k = 1 \dots N$$
 - The $\Delta x, \Delta y$ are called the **sampling intervals**

Digital colour images

Spatial resolution

- Spatial resolution: number of pixels per unit of length
- Example: resolution decreases by one half each time (see right)
- Human faces can be recognized in 64 x 64 pixels images
- Appropriate resolution is essential:
 - Too little resolution, poor recognition
 - Too much resolution, slow and wastes memory

Add WeChat powcoder

Quantisation

- Quantisation digitises the intensity or amplitude values $F(x,y)$
 - Called intensity or gray level quantisation
 - Gray-level resolution to be chosen
 - For example 16, 32, 64, ..., 128, 256 levels
 - Number of levels should be high enough for human perception of shading details... requires about 100 levels for a realistic image
